

When finished, hit "Commit Edits" button -->
put request (use same id), sends an update
request using same id, only changes non_id
fields on JobPosting on mongoDB

On entering info, on continue, use
the same sort of setup (make use
of **process_matches** dispatch)

Use props to setState on a local
condition --> initially, all of your form
inputs are set to be filled by the
jobPosting

/edit

Edit job process (based on Create),
pass in appropriate props (id,
jobPosting)

User clicks
Edit

1. useEffect call to grab JobPosting
data (id is the slug)

/view

User clicks on
the jobTitle in
Profile Table
